SYNTHETIC PORTFOLIO — Academy practice material
Amara Okoye — fictional professional persona

Project: Cedar Library reporting tools
Purpose: practise reliable transformations of fictional library-loan data.
Stack: Python and SQLite.

Demonstrated practices
Input validation rejects incomplete or malformed loan records.
Unit tests check expected transformations and invalid-input handling.
Documented provenance explains that course records are synthetic.

Walkthrough outline
1. Inspect the supplied input and its documented limitations.
2. Validate fields before storing records in SQLite.
3. Run tests before using the reporting output.
4. Describe only demonstrated behaviour; do not invent business results.

Discussion prompt
How would you document a café’s synthetic lending dataset?
The café question is a Unicode extraction exercise, not a new career claim.

Source boundaries
No revenue, performance percentage, awards or live client outcome is claimed.
This portfolio is a fictional teaching document, not evidence of real work.
Newly extracted material requires human approval before retrieval use.
